

CareerConnect - Sprint1 AI Usage Log

Team Member: Wassim Amrani

Sprint: Sprint 1

Course: SOEN 341

AI Log Entry 1

Task ID/Title:

Sprint 1 Requirements Checklist

Purpose of AI Use:

Requirements analysis and project planning checklist for sprint 1.

Chat Link or Prompt/Response:

Full prompt is included in Appendix A

AI-Suggested Content:

The AI generated a Sprint 1 master checklist organized into GitHub setup, README requirements, user stories and tasks, sprint planning, meeting minutes, AI usage, implementation, contribution tracking and final submission requirements.

Validation:

The checklist was compared with the official Sprint1 project instructions to verify that every required activities and deliverables were included.

Decision:

Accepted.

Reflection:

The AI helped organize the tasks and requirements for Sprint1, making it into a checklist so it's easier to understand.

Responsible Person:

Wassim Amrani

AI Log Entry 2

Task ID/Title:

Backend Feature 1: User Registration and login

Purpose of AI Use:

To plan, implement, test, and validate the backend for the first Sprint 1 feature: user registration and login.

Chat Link or Prompt/Response:

Planning: <https://chatgpt.com/share/6ab586a3-e984-83ea-8aa0-b71c2d74fb15>

Implementation: https://chatgpt.com/s/cx_6ab6e42982f48191973bf7d149083cc3

AI-Suggested Content:

ChatGPT was used during the planning stage to prepare the implementation approach for Feature 1 and to determine how Codex should work with the CareerConnect repository. It recommended giving Codex access to the complete project workspace rather than only the empty backend folder and providing the official SOEN 341 project document so that the implementation remained within Sprint 1 scope.

Codex used directly on the repository to implement the backend. The resulting Feature 1 included Node.js/Express application structure, SQLite database initialization, registration and login endpoints, input and email validation, duplicate-email prevention, bcrypt password hashing, parameterized SQL queries, safe API responses without password hashes, and automated tests.

Validation:

The generated implementation was reviewed and tested locally before Feature 2 was started. Automated tests checked successful registration, persistence of users in SQLite, required fields, email validation, case-insensitive duplicate emails, bcrypt password storage, successful login, incorrect passwords, nonexistent users, and protection against exposing password hashes.

All 10 Feature 1 automated tests passed before Resume Upload implementation began. Codex later reran these tests while extending authentication for Feature 2 to ensure the original registration/login behavior had not been broken.

Decision:

Accepted with modifications

Reflection:

Using ChatGPT before Codex helped understanding the implementation scope and gave Codex detailed project-specific instructions instead of requesting code without context. Codex accelerated the actual implementation, but the generated backend was not considered complete until its behavior was reviewed and the automated tests passed. This process also made it easier to extend Feature 1 safely when authentication requirements changed during Feature 2. Every step codex did was reviewed and approved by the responsible person.

Wassim Amrani

AI Log Entry 3

Task ID/Title:

Backend Feature 2: Resume Upload

Purpose of AI Use:

To plan, implement, test, and validate the backend for the first Sprint 1 feature 2: resume upload. It ensured that it integrated correctly with the registration/login backend.

Chat Link or Prompt/Response:

Planning: <https://chatgpt.com/share/6ab586a3-e984-83ea-8aa0-b71c2d74fb15>

Implementation: https://chatgpt.com/s/cx_6ab6e42982f48191973bf7d149083cc3

AI-Suggested Content:

ChatGPT helped define the scope for feature 2, database relationship, upload endpoint, validation requirements, and testing approach. Codex then inspected the existing backend, identified the need for persistent authentication, and proposed a signed cookie session. After approval, Codex implemented authenticated PDF uploads, resume metadata storage, user association, file validation, error handling, and automated tests. Every step codex did was reviewed and approved by the responsible person.

Validation:

Validation occurred throughout implementation rather than only after the feature was complete.

After installing the new session and upload dependencies, Codex reran all 10 existing Feature 1 tests. After creating the resumes table, the foreign-key relationship was tested by attempting to associate a resume with nonexistent user 999, which SQLite rejected. After signed authentication was introduced, the original Feature 1 tests were rerun again. Only then was the protected upload pipeline implemented.

The completed backend was tested for successful PDF upload, physical file storage, SQLite metadata persistence, correct authenticated-user association, missing files, invalid file types, oversized files, unauthenticated requests and duplicate original filenames.

Final automated result:

Feature 1: 10 tests passed

Feature 2: 10 tests passed

Total: 20 tests passed, 0 failures

Decision:

Accepted with modifications

Reflection:

This interaction showed why AI-generated implementation should be reviewed rather than accepted immediately. ChatGPT provided the initial architecture but intentionally left the exact authentication mechanism undecided until the existing login implementation could be inspected. Codex identified the missing authenticated-session requirement and proposed a solution before changing Feature 1. Reviewing and approving that change, followed by incremental testing, helped ensure that Resume Upload integrated well without breaking registration/login.

AI Log Entry 4

Task ID/Title:

Frontend UI/UX Redesign and Backend API Preparation

Purpose of AI Use:

To audit the team's existing frontend and redesign it into a more professional, responsive and accessible CareerConnect interface while preparing it to communicate with the completed Sprint 1 backend.

Chat Link or Prompt/Response:

https://chatgpt.com/s/cx_6ab6e42982f48191973bf7d149083cc3

AI-Suggested Content:

Codex was instructed to inspect the existing frontend before modifying it. Its audit found that the branch contained three primarily static HTML pages and one shared stylesheet, with no API calls, no real form submission, no resume-upload interface, no responsive navigation and very limited JavaScript. The AI then performed a broader frontend redesign rather than only changing colors or styling. The work generated a professional landing page, redesigned registration and login experiences, a dedicated authenticated workspace/dashboard, a resume-upload interface, client-side form validation, backend-compatible API requests, a reusable API layer

supporting signed cookies, responsive layouts, improved navigation, consistent visual hierarchy and accessibility-focused interaction states. The initial HTML/CSS/JavaScript stack was kept. This was then optimized by changing the initial font and the logo for a more professional look.

Validation:

The redesigned frontend was reviewed locally. Navigation, form behavior, API request structure, responsive layouts and authenticated resume-upload UI were checked. Compatibility with the backend implementation was also reviewed, including the registration and login endpoints, authenticated cookie behavior and the multipart resume field expected by the upload endpoint.

Decision:

Accepted with modifications

Reflection:

The AI was useful because it started with a deep audit of the existing frontend implementation rather than just assuming that only visual changes were required. This exposed technical limitations as well as UI problems, particularly the absence of API integration and the use of a file:// workflow. Keeping the redesign within the existing technology stack and on a separate branch made the changes easier to review and reduced the risk of interfering with the tested backend.

AI Log Entry 5

Task ID/Title:

Frontend Backend Integration, Debugging and Validation

Purpose of AI Use:

To safely combine the completed frontend and backend, identify the integration problems, debug the combined application, and validate the complete Sprint 1 workflow before updating the shared development branch.

Chat Link or Prompt/Response:

https://chatgpt.com/s/cx_6ab6e42982f48191973bf7d149083cc3

AI-Suggested Content:

Codex first compared the frontend and backend instead of immediately merging them into the shared branch. It identified that a normal merge was insufficient because the backend served the page directory but did not expose the frontend's /css, /js, and /assets directories.

To reduce the risk of disrupting shared work, Codex created a separate local integration branch. It combined the frontend and backend there, added the required Express static routes, and resolved a .gitignore merge conflict while preserving exclusions for generated database/upload files and backend secrets. Serving both sides from the same Express application also allowed the signed authentication cookies and API requests to operate on the same origin.

During the live end-to-end test, an additional issue appeared: the signed session consisted of two cookies, but the initial smoke-test request forwarded only one. Codex diagnosed this as a testing-harness issue rather than an application failure, corrected the cookie handling, and repeated the authenticated upload test.

Validation:

The combined application was validated before the remote **dev** branch was modified.

The complete automated backend suite was rerun and produced:

20 tests passed

0 tests failed

Decision:

Accepted with modifications

Reflection:

This interaction showed that AI was useful beyond initial code generation. Testing the frontend and backend together revealed integration issues that were not visible when each branch was evaluated separately. Using an isolated integration branch, reviewing the suggested fixes, rerunning the automated tests and completing a live complete test provided more evidence that the combined Sprint 1 product worked before it was introduced into the team's shared development workflow.

Appendix A - AI Interaction Evidence

Prompt: Review the SOEN 341 CareerConnect Sprint 1 project instructions. Create a concise Sprint 1 master checklist for our GitHub repository covering GitHub setup, README, user stories and tasks, sprint planning, team development process, meeting minutes, AI usage, implementation, contribution tracking, Appendix A work plan, and final submission. Use markdown checkboxes so our team can track completion. Don't make it too precise, keep it simple.

AI Response: # Sprint 1 Master Checklist

****Deadline:**** September 28, 2026

1. Project Setup

- ☒ Create and organize GitHub repository
- ☒ Confirm all 6 members have access
- ☐ Create GitHub Project board
- ☐ Finalize technology stack and development environment

2. README

- ☐ Complete team member information
- ☐ Finalize technologies and setup instructions
- ☐ Final review of README

3. User Stories & Requirements

- ☐ Generate and review 10 AI user stories
- ☐ Brainstorm original team-generated stories/features
- ☐ Create at least 15 total user stories as GitHub Issues
- ☐ Add tasks, labels and assignments to the user stories

4. Sprint Planning

- ☐ Create Sprint 1 backlog
- ☐ Define priorities and effort estimates
- ☐ Determine team capacity and risks
- ☐ Assign and schedule Sprint 1 work
- ☐ Complete Appendix A Sprint 1 Work Plan

5. Team Process

- ☐ Define Git workflow and branching strategy
- ☐ Define pull request and code review process
- ☐ Define Definition of Ready and Definition of Done

6. Project Documentation

- ☐ Maintain meeting minutes
- ☐ Maintain individual AI usage logs
- ☐ Maintain team member contribution records

7. Implementation

- ☐ Select two basic Sprint 1 features
- ☐ Implement and test Feature #1
- ☐ Implement and test Feature #2
- ☐ Prepare project demonstration

8. Final Submission

- ☐ Prepare Sprint 1 submission document
- ☐ Include cover page, team members, README and GitHub link
- ☐ Final repository and documentation review
- ☐ Confirm demo and submission are ready
